Project Scope Document

Rivana Residence — Website & Hotel Management System

CLIENT	**Rivana Residence**
DOCUMENT	**Initial Project Scope**
VERSION	**1.0**
DATE	**15 August 2026**
STATUS	**For Client Review & Approval**

> This document defines the agreed features, responsibilities and deliverables for the new system. Its purpose is to establish a clear, shared understanding of the project scope before development begins.

> Hello, to make sure we have a clear scope for the project and avoid any misunderstanding later, I would like to confirm the features and responsibilities of the new system.

1. Public Website

We will rebuild the current Rivana Residence website from scratch while keeping the same overall design, UI and UX as the existing website.

The website will include:

- Home page
- About Us
- Rooms / Accommodations
- Room details
- Amenities / facilities
- Contact Us
- Terms & Conditions
- Cancellation / Refund Policy
- Booking / Reservation flow
- Responsive design for mobile, tablet and desktop

The website content, images and other editable information will be manageable from the Admin Dashboard.

2. Rooms & Pricing

The system will allow management of rooms and their prices.

Admin will be able to:

- Add new rooms
- Edit room information
- Upload / change room images
- Edit room capacity and amenities
- Enable / disable rooms
- Set room prices
- Define different prices for specific periods
- Create seasonal / date-based pricing

EXAMPLE

Room A

- 01/09 → 15/09 = 3,000 EGP / night
- 16/09 → 30/09 = 3,500 EGP / night

The system should automatically use the correct price based on the customer's reservation dates.

3. Offers & Promotions

Admin will be able to create offers with a specific validity period.

EXAMPLE

"Summer Offer"
From 01/06 to 30/06
Room X = 2,500 EGP / night

The system should automatically apply the applicable offer / price when a customer makes a reservation.

We can also support loyalty offers for registered customers.

4. Reservation System

Customers will be able to:

- Select check-in and check-out dates
- Select number of guests
- View available rooms
- See the applicable price
- Enter their personal information
- Submit a reservation
- Receive reservation confirmation

The reservation system will be connected to the hotel's existing reservation / property management system through its API.

The flow will be:

1. Customer searches for a room and dates.
2. Our system checks the availability through the hotel's system / API.
3. If the room is available, the system retrieves and applies the correct price.
4. Customer submits the reservation.
5. Our system sends the reservation request to the hotel's system.
6. Once the reservation is successfully created / confirmed, the customer receives confirmation.
7. The reservation will also appear in our dashboard.

We will also handle cases where availability changes between the availability check and the final reservation request, so that we don't accidentally create an overbooking.

Payment Methods

The system will support two payment options:

- **Online Payment** — via an integrated payment gateway such as Stripe, Paymob, etc., depending on availability in the region.
- **Pay on Arrival** — the customer pays at the hotel during check-in.

The selected payment method will be stored with the reservation and reflected in both the dashboard and the hotel system integration.

5. Customer Verification & Notifications

After a reservation is submitted, the system will send the customer the required verification / confirmation through:

- Email
- WhatsApp

The exact verification process, and whether the reservation must be verified before being confirmed, will be finalized with you.

6. Customer Accounts & Loyalty

Customers will be able to create accounts and log in. Their accounts can contain:

- Personal information
- Reservation history
- Current / upcoming reservations
- Previous stays
- Loyalty information
- Special offers available to them

This will allow us to introduce customer loyalty offers and targeted promotions in the future.

7. Management Dashboard

There will be one dashboard with different permissions depending on the user's role.

Receptionist

- View reservations
- View reservation details
- Accept reservations
- Decline reservations
- View customer information
- View room availability
- Manage the reservation workflow according to their permissions

Receptionists will not be able to change system-wide settings, prices or website content.

Manager

All receptionist capabilities, plus:

- Edit room prices
- Manage applicable pricing
- Accept / decline reservations
- View reservation information
- View hotel statistics and reports
- View occupancy / reservation statistics
- Monitor room availability and performance

Admin

Full access to the system, including everything available to the Manager, plus:

- Add / edit / delete rooms
- Manage room images
- Manage room information
- Manage prices
- Create date-based prices
- Create and manage offers
- Edit website texts
- Edit website images
- Manage website content
- Manage customers
- Manage users
- Create receptionist / manager accounts
- Assign user roles and permissions
- Manage branches and branch information
- Manage branch-specific rooms, images and prices
- Manage system settings
- Manage the external reservation system integration

8. Multi-Branch Support

The system should support multiple hotel branches. Admin will be able to create a new branch and configure:

- Branch name
- Branch information
- Branch images
- Rooms
- Prices
- Offers
- Contact information
- Website content

EXAMPLE — BRANCH SUBDOMAINS

```
branch1.domain.com
branch2.domain.com
```

The customer should see the correct rooms, prices, images, offers and information depending on the selected branch.

9. Dashboard Permissions & Security

Each user will have their own account.

The system will use role-based permissions so that each user can only access the features they are authorized to use.

We will also keep records of important management actions, so we can know which user made important changes such as changing prices, editing reservations or modifying website content.

10. Statistics

The Manager / Admin dashboard will include useful statistics such as:

- Number of reservations
- Confirmed reservations
- Cancelled / declined reservations
- Occupancy
- Room performance
- Revenue-related statistics, where the required financial data is available
- Reservation trends over selected periods

The exact statistics and reports can be finalized based on the hotel's requirements.

11. Important Points We Need to Confirm

Before development starts, we should confirm:

- The name and API documentation of the hotel's existing reservation / property management system
- What information its API provides
- How availability is checked
- How reservations are created
- How cancellations / modifications are handled
- Whether prices come from our system or the external hotel system
- The exact WhatsApp verification process
- Email provider
- WhatsApp provider
- Payment method, if online payment will be required
- Cancellation and refund rules
- Exact user permissions
- Exact statistics required
- Branch / subdomain structure
- Loyalty program rules
- Whether customers can modify / cancel their reservations from their accounts

This document will be our initial project scope. Any feature or requirement added after we agree on this scope can be evaluated separately, so that we can clearly track changes to the project.
